

FTP & SAMBA

FTP

Sometimes anonymous login is allowed on a FTP server.

```
ftp <server/ip>
```

During the login you'll get asked to provide a user name and then you just enter: anonymous

SAMBA

Access without username or password

There are also some cases where you are allowed to login to a Samba share without username or password. To perform this follow these steps:

```
smbclient //host/share -U %
```

OR

```
smbclient //host/share -U "" ""
```

Access with password

If you were able to get a password you can access the SAMBA share like this:

```
smbclient //host/share
```

Then you'll get asked to enter the password.

Download the whole Share

You can download the whole samba share with following command:

```
smbget -R smb://<ip>/<sharename>
```

Everything which is stored on the specified share will get downloaded.
